

Individual Reflection

Week 4

Malin Rosén

This week's focus was more vertical, which meant that focus was on the database (JSON) and JavaScript so we could incorporate some functionality to our website. I think that our first iteration of code turned out well, but I think there are definitely some things that we can refactor in the future since there is quite a bit of duplicated code. My goal is to get an even better grip of JavaScript and make more reliable code.

I have some previous experience working with JavaScript, which meant that I could help other group members who didn't have as much. We split into groups again, and I let the others code while I explained some things along the way. I feel like this is a good strategy, since they can learn while I go over what I already know and that way get a better understanding of things.

I helped write up the tasks for the user stories, and moved them to the correct columns in our scrum board when needed. We did a better job this week with following our definition of done and testing, but we're still missing some in the reviewing department. In the future we have to start using the review feature on GitHub when we create pull requests, since it will make reviewing easy and convenient for everyone.

As all other weeks, we all helped and wrote the team reflection, which was this week's deliverable. I wrote the things I was supposed to, and when it had all come together we all checked it together to make sure that it was okay to hand in.
